BACKEND SOFTWARE ENGINEER

Backend engineer building production APIs and financial systems in regulated environments, with a focus on payment workflows and compliance. Experience delivering scalable services, refactoring legacy code, and improving system reliability. Background in financial services provides strong domain understanding of risk, compliance, and data integrity.

TECHNICAL SKILLS

Languages: C#, .NET, SQL, Python

Backend: REST APIs, API integrations, event-driven systems

Architecture: Domain-Driven Design (DDD), SOLID, design patterns (Observer, Interpreter, Command)

Databases: SQL Server, MySQL

Tools: Git, Swagger, Postman, Docker, Azure DevOps

Cloud: Azure

Other: CI/CD exposure, automated testing workflows

PROFESSIONAL EXPERIENCE

GoldPoint Systems

2024 – Present

Core Service Developer

Orem, UT

- Designed and deployed production REST APIs supporting loan servicing, payments, compliance, and litigation workflows in a regulated fintech environment.
- Delivered a backend feature generating \$30K in revenue while reducing downstream legal risk for clients.
- Refactored duplicated logic into shared abstractions, reducing future development time by approximately 85% across related services.
- Developed Salesforce-integrated APIs enabling real-time synchronization of customer payment data and account updates across systems.
- Resolved complex edge-case defects identified in QA and production, improving system stability and reducing recurring failures.
- Collaborated within an agile, sprint-based development environment with cross-functional teams including QA and product stakeholders.

CUSO Financial

2022 – 2024

Financial Advisor

- Grew assets under management by \$6MM in six months through portfolio strategy and client trust-building.
- Developed strong understanding of financial systems, risk, and compliance now applied to backend engineering.
- Transitioned into software engineering to build systems supporting financial decision-making.

FEATURED PROJECT

FreightBid Agent

2026 | Python, APIs

- Building an AI-assisted decision system to evaluate and prioritize freight loads based on profitability, constraints, and route optimization.
- Designed modular architecture separating load evaluation, constraint validation, and scoring strategies.
- Incorporates real-world factors such as deadhead distance, driver hours, and market conditions into decision logic.

EDUCATION & CERTIFICATIONS

Microsoft Certification

2025

Azure AI Fundamentals (AI-900)

Western Governors University

2019

Bachelors - Business Marketing Management
