BACKEND SOFTWARE ENGINEER

Backend software engineer building production APIs, financial systems, and applied AI tools. Experience delivering backend services in regulated fintech environments with a focus on payments, compliance workflows, data integrity, and system reliability. Strong project work in optimization, machine learning assisted decision systems, SaaS architecture, and API-first product development.

TECHNICAL SKILLS

Languages: C Sharp, .NET, SQL, Python

Backend: REST APIs, API integrations, FastAPI, service-layer architecture, backend validation

Architecture: Domain-Driven Design, SOLID, modular systems, design patterns, event-driven concepts

Databases: SQL Server, PostgreSQL, MySQL

AI and Optimization: ML-assisted scoring, simulation, route optimization, OR-Tools, benchmark harnesses

Tools: Git, Swagger, Postman, Docker, Azure DevOps, Render, Vercel

Other: CI/CD exposure, automated testing workflows, technical documentation

PROFESSIONAL EXPERIENCE

GoldPoint Systems

2024 – Present

Core Service Developer

Orem, UT

- Designed and deployed production REST APIs supporting loan servicing, payments, compliance, and litigation workflows in a regulated fintech environment.
- Delivered a backend feature generating USD 30K in revenue while reducing downstream legal risk for clients.
- Refactored duplicated logic into shared abstractions, reducing future development time by approximately 85 percent across related services.
- Developed Salesforce-integrated APIs enabling real-time synchronization of customer payment data and account updates across systems.
- Resolved complex edge-case defects identified in QA and production, improving system stability and reducing recurring failures.
- Worked across backend services, database logic, QA workflows, and product requirements to deliver reliable features in sprint-based development.

CUSO Financial

2022 – 2024

Financial Advisor

- Grew assets under management by USD 6MM in six months through portfolio strategy, client trust-building, and disciplined follow-up.
- Built strong working knowledge of financial systems, risk management, client data, and compliance expectations.
- Transitioned into software engineering with domain experience in financial services and a practical understanding of user needs in regulated industries.

SELECTED TECHNICAL PROJECTS

FreightBid Agent

2026 | Python, FastAPI, OR-Tools, ML, Simulation

- Built an AI-assisted freight decision system for hotshot load evaluation, ranking, and profit-aware route planning.
- Designed domain models for loads, truck state, constraints, scoring, and planning to keep business logic testable and modular.
- Implemented profit-aware optimization using OR-Tools to evaluate load combinations against revenue, deadhead miles, time, and operational constraints.

- Added destination-aware planning that reduced deadhead by 12.9 percent in A/B simulation while limiting profit impact to 0.9 percent.
- Developed rolling replanning simulations across 7-day dispatch episodes, improving cumulative profit by 3.9 percent and reducing deadhead by 4.7 percent.
- Built ML-assisted onward deadhead risk scoring using historical snapshots, zone hubs, embargo windows, and destination supply features.
- Created benchmark and testing workflows to compare planner strategies, validate deterministic behavior, and support future Truckstop API integration.

CustodiFlow

2026 | FastAPI, PostgreSQL, Render, Vercel, QR Workflows

- Built a janitorial inventory SaaS platform for barcode and QR-based supply tracking, reorder workflows, site management, and pilot onboarding.
- Designed multi-tenant backend workflows for sites, inventory items, suppliers, scan events, reorder thresholds, purchase lists, and audit-style activity reporting.
- Implemented label generation workflows for field use, including QR label PDFs and handheld label printer validation for real-world inventory operations.
- Built supplier price book logic so cheapest per-unit pricing can sync to inventory cost and generate purchase lists grouped by supplier.
- Created demo tenant data for Wasatch Commercial Cleaning with multiple sites, items, suppliers, and historical scan activity for product demos.
- Added pilot launch infrastructure including public pilot lead capture, admin lead management, staging deployment, and launch documentation.
- Deployed staging environment with backend, database, and frontend hosting to support smoke testing, demo login, and pilot preparation.

Additional Engineering Work

2026 | API Design, Testing, Documentation

- Built and maintained test suites across personal projects to validate backend behavior, regression risks, and core business logic.
- Created technical documentation, configuration files, seed data, and CLI workflows to make projects easier to run, demo, and extend.
- Used project work to deepen practical experience with backend architecture, applied AI systems, API boundaries, and production-style deployment concerns.

EDUCATION AND CERTIFICATIONS

Microsoft Certification	2025
<i>Azure AI Fundamentals AI-900</i>	
Western Governors University	2019
<i>Bachelor's - Business Marketing Management</i>
